Pulmonary Pharmacology. Pulmonary Pharmacology. This chapter discusses the pharmacotherapy of obstructive airways disease, particularly bronchodilators, which act mainly by reversing airway smooth muscle contraction, and anti-inflammatory drugs, which suppress the inflammatory response in the airways. The chapter focuses on the pulmonary pharmacology of ? 2 agonists and corticosteroids; their basic pharmacology is presented elsewhere (see Chapters 12 and 42).

Abstract. The approval of macitentan has increased the number of pharmacological treatments of pulmonary arterial hypertension (PAH). Here, we review the effect on PAH of macitentan compared to other endothelin receptor antagonists. Drugs targeting the endothelin (ET) pathway include the selective ET A receptor antagonist ambrisentan, the ET A /ET B receptor antagonists, bosentan and macitentan, which were recently approved for PAH treatment.

Abstract. Current treatment of pulmonary arterial hypertension (PAH) targets three signalling pathways: the nitric oxide (NO) pathway, the endothelin pathway and the prostacyclin pathway. Riociguat is a soluble guanylate cyclase stimulator, acting via the NO pathway in a new way: unlike other common drugs targeting this pathway (eg tadalafil and sildenafil), riociguat acts independently of endogenous NO.

Abstract: Anticoagulation is recommended for prophylaxis and treatment of venous thromboembolism (VTE) (deep vein thrombosis and pulmonary embolism) and/or arterial thromboembolism. The therapeutic arsenal of anticoagulants available to clinicians is mainly composed by unfractionated heparin (UFH), low-molecular-weight heparin (LMWH), fondaparinux and oral vitamin K antagonists (VKA) (i.e. warfarin and acenocumarol).

Comparative Biology of the Normal Lung, 2nd Edition, offers a rigorous and comprehensive reference for all those involved in pulmonary research. This fully updated work is divided into sections on anatomy and morphology, physiology, biochemistry, and immunological response. It continues to provide a unique comparative perspective on the mammalian lung. This edition includes several new chapters and expanded content, including aging and development of the normal lung, mechanical properties of the lung, genetic polymorphisms, the comparative effect of stress of pulmonary immune function, oxygen signaling in the mammalian lung and much more. By addressing scientific advances and critical issues in lung research, this 2nd edition is a timely and valuable work on comparative data for the interpretation of studies of animal models as compared to the human lung. Edited and authored by experts in the field to provide an excellent and timely review of cross-species comparisons that will help you interpret and compare data from animal studies to human findings Incorporates lung anatomy and physiology, cell specific interactions and immunological responses to provide you with a single and unique multidisciplinary source on the comparative biology of the normal lung Includes new and expanded content on neonatal and aged lungs, developmental processes, cell signaling, antioxidants, airway cells, safety pharmacology and much more Section IV on Physical and Immunological Defenses has been significantly updated with 9 new chapters and an increased focus on the pulmonary immunological system

Cardiopulmonary Pharmacology for Respiratory Care provides a reliable, complete resource and reference on cardiopulmonary pharmacology, including an overview of the structures and functions of the cardiopulmonary system as well as recent scientific advancements. Written in an easy-to-read, student-friendly style, this text covers areas crucial to respiratory care and relates these important concepts to the day-to-day duties of cardiac technicians and respiratory care therapists.Helpful appendices focus on the most commonly-prescribed drugs for respiratory care, common sound-alike drug names, a drug identification guide, and respiratory therapy techniques. Review questions are included in each chapter for reinforcement and self-evaluation. Filled with over 100 full-color figures, tables, and photos, this text is a vital and comprehensive resource on cardiopulmonary pharmacology for respiratory therapy students.Each new text includes an online code to access the Student Resources available on the Companion Web Site. Electronic versions and eBooks do not include access to the companion website content.

The Lung Circulation deals with important aspects of the lung circulation, with emphasis on the physiology of the pulmonary and bronchial circulation and autonomic pharmacology. Topics covered range from the role of anoxia in pulmonary circulation to reflexes arising from the pulmonary circulation and neighboring structures. The release of chemical substances from the pulmonary and bronchial circulation is also discussed. This volume is comprised of 10 chapters and begins with a review of the influence of anoxia on pulmonary circulation as well as four pertinent effects of anoxemia, namely, respiratory stimulation; cardiac stimulation; systemic vasoconstriction and vasodilatation; and pulmonary vasoconstriction and vasodilatation). The following chapters focus on the regulation of bronchial circulation; autonomic nervous control of pulmonary circulation involving acetylcholine, anticholinesterases, and atropine; and the pharmacology of sympathomimetic drugs, sympathetic blocking drugs, ganglion stimulants, and blocking drugs. The final chapter is devoted to the pharmacology of the autonomic nervous system and considers drugs that stimulate chemoreflexes arising from the lung circulation, including veratrum alkaloids. This book will appeal to physiologists and pharmacologists.
