Speed of light, in vacuum, is a constant, denoted by  $c$ , and is approximately  $3 \times 10^8$  m/s. The refractive index of a medium is defined as the ratio of the speed of light in vacuum to the speed of light in the medium. For example, the refractive index of water is approximately 1.33, which means that light travels about 1.33 times slower in water than in vacuum. The refractive index of a medium is a function of the wavelength of light, and is also affected by the temperature and pressure of the medium. The refractive index of a medium is a measure of how much the medium slows down light. The refractive index of a medium is a measure of how much the medium slows down light. The refractive index of a medium is a measure of how much the medium slows down light.
