Tissue Engineering is the application of science to improve, restore and maintain the damaged tissues or the whole organ. It makes tissues functional by combining scaffolds, cells and biologically active molecules. Although it was considered to be a subfield of biomaterials, it has emerged widely on its own.

While most definitions of tissue engineering cover a broad range of applications, in practice the term is closely associated with applications that repair or replace portions of or whole tissues i. Often, the tissues involved require certain mechanical and structural properties for proper functioning.

*Introduction to tissue engineering applications and ...*

Tissue engineering covers a broad range of applications, in practice the term has come to represent applications that repair or replace structural tissues (i.e., bone, cartilage, blood vessels, bladder, etc). These are tissues that function by virtue of their mechanical properties. A closely related (and older) field is cell transplantation.
